

Love Science

In First Grade we love science and we love actively participating in science. We start each lesson with rules and safety procedures. The purpose of this lesson was to answer the question "What do scientists do?" We mixed acetic acid with sodium bicarbonate and followed the scientific inquiry steps. First we Observe the components separately and then we asked the question, "what would happen if we mixed the two together?" Next we take our best guess as to what might happen; make a hypothesis. Then we get to do our experiment and see if our guess was right. Finally we collect data and write a conclusion to our experiment.
